Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll

Example 2; Page 42; 97pp; English.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis

chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), sylvalomehitis, and adder disease, menumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. The present sequence represents a reverse primer used to detect a nucleotide change at codon 399 of the human TLR4 gene,
                                                                                                                                                                                                                                                                                                                                                                                                                             Human, TLR, Toll-like receptor; dendritic cell associated protein; autoimmune disorder; psoriasis; inflammatory bowel disease; asthma; multiple sclerosis; lupus erythematosus; rheumatoid arthritis; cancer; type I diabetes; infectious disease; gene therapy; immunosuppressive; antinflammatory; neuroprotective; dermatological; antibacterial; virucide; cytostatic; reverse transcription; RT; PCR; primer; ss.

The invention relates to a method for generating a dendritic cell associated protein. The invention also relates to compositions and methods for generating an antibody against a dendritic cell associated protein. The methods and compositions are useful for diagnosing and treating diseases associated with altered dendritic cell activity such autoimmune disorders, e.g. psoriasis, inflammatory bowel disease, asthma, multiple sclerosis, lugus erychematosus, rheumatoid arthritis or type I diabetes, and cancer or infectious disease. The invention is also used in gene therapy. The present sequence is a RI (reverse transcription)-PCR perimer used for amplifying human TLM (Toll-like receptor) DNA. This sequence is used to illustrate the method of the invention Isolating dendritic cell associated protein using an agent which alters its expression or activity, useful in diagnosing and treating disorders with altered expression or activity of the protein, such as autoimmune Example 9; Page 56; 73pp; English. disease and cancer.

altered innate immunity involves detecting or determining whether DN amplified from a biological sample encodes a portion of variant toll dentifying humans at risk of, or having indication associated with receptor 4.

Claim 33; Page 42; 97pp; English.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 unclaic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis. Creverity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for pre-term infants, agents which alter TLR4 activity are useful for pre-term infants, agents which alter TLR4 activity are useful for pre-term infants, agents which alter TLR4 activity are useful for in pre-term infants, agents which alter TLR4 activity are useful for creventing or ameliorating infection by gram-negative bacteria, sepsis induced chinded by gram-negative bacteria, negative sepsis induced chinded disease, preumonia, bronchitis, chronic syndrome (STRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, preumonia, bronchitis, chronic cobstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. The present sequence represents a forward primer used to detect a nucleotide change at codon 259 of the human TLR4 gene, and cystic fibrosis. used in a PCR based RFLP assay to genotype patients for TLR4

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis.

The presence of TLR4 mutation is associated with gram-negative sepsis in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, included inflammatory disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (RDS), choolic obstructive pulmonary disease, pneumonia, bronchitis, chronic and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for

The present invention describes an anti-CD14 antibody, which has a function of inhibiting the binding of CD14 to the Toll-like receptor (TLR). The anti-CD14 antibody can specifically recognise the epitope containing the domain from numbers 269-315 in human CD14 of the sequence in AAG68127 or a part of it. Anti-CD14 antibody has antibacterial, immunosuppressive, antipyretic, hypertensive, immunostimulant, haemostatic and vasotropic activities. The antibody together with other polypeptides are applicable in drugs for treating bacterial infection as well as sepais, fever, hypotension, leukopaenia, thrombopaenia, shock and multi-organ failure. AAG68127 to AAG68137 and AAI71210 to AAI71295
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-CD14 antibody or its fragment inhibiting the binding of CD14 to Toll -like receptor, applicable in drugs for treating bacterial infection as well as sepsis, fever, hypotension, leukopenia, thrombopenia and shock..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represent sequences used in the exemplification of the present invention

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis.

The presence of TLR4 mutation is associated with gram-negative sepsis in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LDS (lipopolysaccharide) induced chronic airway disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory response inflammatory disease, asthma, arthritis, local and systemic inflammatory disease, asthma, arthritis, local and systemic syndrome (SIRS) or acute respiratory distress syndrome (ARS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 mucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 muctation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for conversity of smellocating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis cinduced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic conditions such as systematic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, nocal gram-negative bacterial infection and cystic fibrosis. Sequences AACM34776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, TLR; Toll-like receptor; dendritic cell associated protein; autoimmune disorder; psoriasis; inflammatory bowel disease; asthma; multiple sclerosis; lupus erythematosus; rheumatoid arthritis; cancer; type I diabetes; infectious disease; gene therapy; immunosuppressive; antiinflammatory; neuroprotective; dermatological; antibacterial;

The invention relates to a method for generating a dendritic cell associated protein. The invention also relates to compositions and methods for generating an antibody against a dendritic cell associated protein. The methods and compositions are useful for diagnosing and treating diseases associated with altered dendritic cell activity such as autoimmune disorders, e.g. psoriasis, inflammatory bowel disease, asthma, multiple sclerosis, lupus erythematosus, rheumatory bowel disease, type diabetes, and cancer or infectious disease. The invention is also used in gene therapy. The present sequence is a RT (reverse transcription)-PCR primer used for amplifying human TLR (Toll-like receptor) DNA. This

The invention relates to an anti-CD14 antibody which can specifically recognise an epitope containing a part of a domain with not less than 8 amino acids in human CD14 in the region from positions 269-315 in a ful defined sequence of 356 amino acids as given in the specification. The antibody is useful in drug compositions for treating sepsis and for screening remedies for sepsis. This polynucleotide sequence represents anti-CD14 related oligonacleotide of the invention 0.6%; Score 24; DB 1; Length 24; 00.0%; Pred. Modifying the expression of Toll-like receptors (TLR), useful for influencing neurodegeneration or neuroprotection in the human CNS, comprises contacting CNS cells with a TLR-expression modifying agent, e.g. alpha B-crystallin.

Disclosure; Page 7; 20pp; English.

The specification describes a method of modifying the expression of at toll-like receptor (TLR) in cells of the human central nervous system (CNS). The method comprises contacting the cells with a TLR-expression modifying agent, selected from substances that are endogenous to the human CNS and its parts or variants, that is capable of altering the expression of a TLR in the cells. The TLR-expression modifying agent is.

inhibiting a neurodegenerative process and/or stimulating a neurodegenerative neuroprotective process in a human being afflicted by a neurodegenerative disorder such as Alzheimer's disease, Parkinson's disease, Pick's disease, multiple sclerosis or stroke. The present PCR primer was used to amplify cDNA encoding human TERI. The primer was used to determine the amount of TLR present in human glia cells in a semi-quantitative RT-PCR pharmaceutical composition for retarding or useful for preparing a 888888888

Modulating expression of a target gene in a cell, for treating cancer, an immune disease, or a nerve disorder, comprises introducing into the cell a polynucleotide that forms a duplex region with an mRNA transcribed from target gene 

Claim 2; SEQ ID NO 162; 865pp; English

This invention relates to a novel method for modulating the expression of a target gene in a cell. Specifically, it refers to the introduction into a call of a polynocleoride that forms a duplex region with an mRNA transcribed from the target gene, where the duplex region comprises a mammalian miRNA target region i.e. a non-coding microRNA (miRNA) that regulates mRNA at a post-transcriptional level. The present invention describes a method for controlling ontogenesis of a mammal, function of a mammalian cell, differentiation of a mammalian cell, differentiation of a mammalian cell, differentiation of a mammalian cell or viability of a mammalian cell in the post-transcriptional phase, which comprises introducing a plasmid vector comprising a promoter and nucleic acid molecule expressing an miRNA or sirNA silencing precursor to the miRNA.

Cocordingly, it provides a cell therapy method for treating cancer, immune disease, nerve disorder (e.g. amyotrophic lateral sclerosis, immune disease, or Alzheimer's disease) or an inflammatory disease by introducing into the cell the miRNA, siRNA silencing precursor to the

methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 mucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, is preventing or ameliorating infection by gram-negative bacteria, sepsis chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS) syndrome (SIRS) or acute respiratory distress syndrome (ARDS) systematic and systematic phenomery disease, local gram-negative bacterial infection obstructive pulmonary disease, local gram-negative bacterial infection
                pharmaceutical compositions that exhibit cytostatic, immunosuppressive, norotropic, neuroprotective and antiinflammatory activities and hence can be used for immunotherapy. This oligonucleotide sequence is a human miRNA target region derived from a target gene of the invention.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered individuals immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, induced by gram-negative bacteria, induced chronic airway disease conditions such as systematic inflammatory response inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS).

Syndrome (SIRS) or acute respiratory distress syndrome (ARDS).

Cobstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene

```

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory disease used as systematic inflammatory disease, local gram-negative bacterial infection obstructive pulmonary disease, local gram-negative bacterial infection costic the exons of human TLR4 gene

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered inmunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, pre-term delivery and respiratory distress syndrome preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, local and systemic circlammatory disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (STRS) or acute respiratory distress syndrome (RTRS).

Syndrome (STRS) or acute respiratory distress syndrome (RDRS), chounce obstructive pulmonary disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, ARCB4776-823 represent PCR primers for and cystic fibrosis. Sequences.
                                                                                TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 22; DB 1; Length 22;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a method of modifying the expression of at a toll—like receptor (TLR) in cells of the human central nervous system (CNS). The method comprises contacting the cells with a TLR-expression modifying agent, selected from substances that are endogenous to the human CNS and its parts or variants, that is capable of altering the expression of a TLR in the cells. The TLR-expression modifying agent is useful for preparing a pharmaceutical composition for retarding or inhibiting a neurodegenerative process and/or stimulating a neurodegenerative process and/or stimulating a neurodegenerative disease, parkinson is disease, pick's disease, multiple sclerosis or stroke. The present PCR primer was used to amplify CDNA encoding human TLRI. The primer was used to determine the amount of TLR present in human glia cells in a semi-quantitative RT-PCR
                                                                                                                                                                                                                                                                                                                                                          Toll-like receptor; TLR; central nervous system; CNS; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; Pick's disease; multiple sclerosis; stroke; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modifying the expression of Toll-like receptors (TLR), useful for influencing neurodegeneration or neuroprotection in the human CNS, comprises contacting CNS cells with a TLR-expression modifying agent, e.g. alpha B-crystallin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                              Antisense PCR primer for human toll-like receptor 4 (TLR4) cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 uncleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, pre-term delivery and respiratory disteress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis induced by gram-negative bacteria, tDR (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AGC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage;

Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a growth factor (VEGF). A patient fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing arceptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) car treated by administering the nucleic acid molecule or the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-1ike tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX7572 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                       present invention describes nucleic acid molecules which modulate the

The intention relates to numeral coil receptor; (Link) indicate and to identify polymorphisms at the human Tik4 locus and to identify individuals at risk of, or having, an indication associated with altered inmunity. A variant Tik4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human Tik4 gene. Since the presence of Tik4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome seventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, ins (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (SIRS) or acute respiratory distress syndrome (AIRS), chronic obstructive pullmonary disease, neumonia, bronchitis, chronic obstructive pullmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequence AAC84776-823 represent PCR primers for

altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll

Example 1; Page 31; 97pp; English.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 uncleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, lbS (llpopolysaccharide) induced chy gram-negative bacteria, LBS (llpopolysaccharide) induced chy gram-negative bacteria, lbS (llpopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic cobstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences ARCH776-821 represent PCR primers for amplifying the exons of human TLR4 gene

The therapeutic agents of the invention are useful for preventing/treating: diseases associated with haemorthagic shock, alcohol induced cirrhosis, adult respiratory distress syndrome, chronic rheumatoid arthritis, ulcerative gastritis, Crohn's disease, glomerulonephritis, infectious carditis, systemic lupus erythematosus, scleroderma, Sjoegren's syndrome, multiple organ failure sequence represents a PCR primer that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Agents for treating diseases associated with endothelial disorders, toxemia or toll like receptor signaling comprise new or known 3-amino-1,2-benzisothiazole compounds.
                  neointima/scar and/or a plaque in a blood vessel after stenting, angioplasty, heart transplantation, by pass surgery, arteriovenous shunting and infection, especially bacterial infection. The method is also useful for modulating tumour growth, and for modulating the effects of rheumatoid arthritis. The present sequence is a PCR primer for human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapeutic agent; endothelial disorder; 3-amino-1; 2-benzisothiazole compound; endothelial disorders; toxaemia; severe toxaemia; toxic shock; haemorrhagic shock; alcock; alcohol induced cirrhosis; adult respiratory distress syndrome; chronic rheumatoid arthritis; ulcerative gastritis; Crohn's disease; glomerulonephritis; infectious carditis; systemic lupus erythematosus; ecleroderma; Sjoegren's syndrome; multiple organ failure; autoimmune disease; multiple sclerosis; PCR; primer; ss; human; toll-like receptor 4; TLR4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to modulating an immune response in an animal. The method of the invention comprises modulating colony stimulating factor-1 (CSF-1) activity in order to modulate the immune response of the animal. Also disclosed is a pharmaceutical composition comprising a modulator of CSF-1 activity and a pharmaceutical carrier. The method or the pharmaceutical correct of the method or the pharmaceutical composition is useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock. The sequences given in records ACC74129-ACC74161 represent primers and probes used in an example from the invention to detect murine genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulating an immune response in an animal, useful for the prophylactic or therapeutic treatment of bacterially-induced septic shock, by modulating colony stimulating factor-1 (CSF-1) activity in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse, immunomodulator; antibacterial; immunosuppressive; CSF-1; colony stimulating factor-1; septic shock; TLR; toll-like receptor; interleukin-12; IL-12; HPRT; hypoxanthine phosphoribosyl transferase;

The present invention describes an anti-CD14 antibody, which has a function of inhibiting the binding of CD14 to the Toll-like receptor (TLR). The anti-CD14 antibody can specifically recognise the epitope containing the domain from numbers 269-315 in human CD14 of the sequence in AAG68127 or a part of it. Anti-CD14 antibody has antibacterial, immunosuppressive, antipyretic, hypertensive, immunostimulant, haemostatic and vasocropic activities. The antibody together with other polypeptides are applicable in drugs for treating bacterial infection as well as sepsis, fever, hypotension, leukopaenia, thrombopaenia, shock and multi-organ failure. AAG68127 to AAG68137 and AAI71230 to AAI71295
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anti-CD14 antibody or its fragment inhibiting the binding of CD14 to To-like receptor, applicable in drugs for treating bacterial infection as well as sepsis, fever, hypotension, leukopenia, thrombopenia and shock.
                                                                                                                          Human, Toll like receptor; TLR; CD14; antibody; anti-CD14 antibody; TLK/CD14 binding inhibitor; antibacterial; immunosuppressive; antipyretic; hypertensive; immunostimulant; haemostatic; vasotropic; bacterial infection; sepsis; fever; hypotension; leukopaenia; thrombopaenia; shock; multi-organ failure; ss.
                                                                                         Human Toll like receptor 4 PCR sense primer 2 SEQ ID NO:8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 20 BP; 4 A; 8 C; 3 G; 5 T; 0 U; 0 Other;

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk off, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LDS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS),

Syndrome (SIRS) or acute respiratory distress syndrome (ARDS),

Systematic fibrosis, Sequences AACG476-823 represent PCR primers for and cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.

methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis.

In pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LDS (lippolysaccharide) induced induced by gram-negative bacteria, LDS (lippolysaccharide) induced inflammatory disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory accounting syndrome (STRS) or acute respiratory distress syndrome (ARDS).

Syndrome (STRS) or acute respiratory distress syndrome (ARDS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TIR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory; disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered individuals immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative Sepsis, con pre-term infants, agents which alter TLR4 activity are useful for in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, included by gram-negative bacteria, included induced conditions such as systemmic inflammatory disease conditions such as systemmic inflammatory disease conditions such as systemmic inflammatory disease conditions such as systemmic inflammatory disease, astham arthritis, local and systemic conspiritis, gall bladder disease, preumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rER4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory; disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.
                                                                                                                                                                                                                                                                                   Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered inmunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory discress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, leS (liopolysaccharide) induced by gram-negative bacteria, LPS (liopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (STRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                    Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 20 BP; 7 A; 6 C; 5 G; 2 T; 0 U; 0 Other;

Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll receptor 4.

Example 1; Page 31; 97pp; English.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LDS (lipopolygaccharide) induced chronic airway disease conditions such as systematic inflammatory response inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), systematic inflammatory disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC64776-823 represent PCR primers for and cystic fibrosis. Sequences AAC84776. amplifying the exons of human TLR4 gene

                                                                                                                                                                                                                                                                                                                                              The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 uncleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or amaliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), prolomophritis, gall bladder disease, pneumonia, bronchitis, chronic constructive pulmonary disease, local gram-negative bacterial infection amplifying the human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll receptor 4.

Example 1; Page 33; 97pp; English.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 unclaic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation lis associated with gram-negative sepsis. Coverity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, proceed by gram-negative bacteria, sepsis induced a riway disease, asthma, arthritis, local and systemic chronic airway disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchtis, chronic and cystic fibrosis. The present sequence represents a reverse primer and cystic fibrosis. The present sequence represents a reverse primer constructive dorm exon 4 of the human TLR4 gene, used in multi-tissue cDNA expression screen

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered individuals at risk of separatory of electing a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LDS (lipopolysaccharide) induced chronic airway disease conditions such as systematic inflammatory response inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), syndrome (SIRS) at all bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for
                                                                                                                                                                               TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic alrway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DN amplified from a biological sample encodes a portion of variant toll

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lorenz E,
                                                             AAC84822;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              receptor
AAC84822
```

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, per-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lippoblysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic chronic airway disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS),

methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered innainty. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, arthritis, local and systemic chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephitis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84772-775 represent PCR primers for amplifying the human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human toll receptor 4 (TLR4) nucleic acid and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll

methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 mucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory discress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LDS (lipopolysaccharide) induced contains arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory disease, asthma, arthritis, local and systemic syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AACS4776-823 represent PCR primers for amplifying the exons of human TLR4 gene

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innunte immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis.

Dieserty of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (SIRS) or acute respiratory distress syndrome (ABRS), choonic obstructive pulmonary disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, agam-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered individuals at tisk of, or having, an indication as a diamostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LBS (lipopolysaccharide) induced chonic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (STRS) or acute respiratory distress syndrome (ATRS), or acute respiratory distress syndrome (ATRS), obstructive pulmonary disease, neumonia, bronchitis, considered form expensed formar aforward primer and cystic fibrosis. The present sequence represents a forward primer and cystic fibrosis. The present sequence represents a forward primer and cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```
The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LBS (lipopolysaccharide) induced chronic airway disease conditions authritis, local and systemic inflammatory disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory disease, preumonia, bronchitis, ornonic obstructive pulmonary disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, pneumonia, bronchitis, chronic and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                     TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                               Human TLR4 gene exon 4 amplifying forward primer.

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered intate immunity. A variant TLR4 is acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepplis. Correspondently of sepals, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepplis induced by gram-negative bacteria, sepplis induced chronic airway disease, asthma, arthritis, local and systemic chronic airway disease, conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS). Pyelonephitits, gall bladder disease, pneumonia, bronchitis, chronic cobstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences Ascass gram-negative bacterial infection and cystic fibrosis. Sequences Ascass gram-negative bacterial infection and cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.5%; Score 20; DB 1; Length 20; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 uncleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLRA mutation is associated with gram-negative sepsis, creatity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AG84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for in pre-term infants, agents which alter TLR4 activity are useful for creating or ameliocrating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LBS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic chronic airway disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic and cystic fibrosis. Sequences AACSA represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 uncleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for in preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis induced by gram-negative bacteria, lDS (lipopolysaccharide) induced chronic airway disease asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephitis, gall bladder disease, pneumonia, bronchtis, chronic and cystic fibroais. Sequences ARG4776-823 represent PCR primers for amplifying the exons of human TLR4 gene Gaps ö 0.5%; Score 20; DB 1; Length 20; 100.0%; Pred. Human TLR4 gene exon 4 amplifying forward primer.

TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human;

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, conserved to TLR4 mutation is associated with gram-negative sepsis, conserved by gram-negative bacteria, sepsis in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis conducted by gram-negative bacteria, sepsis conducted by gram-negative bacterial, LDS (lippoblysaccharide) induced chronic airway disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pelonophritis, gall bladder disease, pneumonia, bronchisis, chronic ond cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene mmatory response syndrome; pyelonephritis; bronchitis; y distress syndrome; gall bladder disease; pneumonia; antibacterial; antiinflammatory; PCR primer; ss. Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll Sequence 20 BP; 4 A; 4 C; 6 G; 6 T; 0 U; 0 Other; Schwartz DA, Schutte BC; Example 1; Page 31; 97pp; English. 08-JUN-2000; 2000WO-US015723. 10-JUN-1999; 99US-00329515. ```
The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, seventity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory disease. Sequences pneumonia, bronchitis, chronic pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                                                                                                       Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 3 A; 5 C; 5 G; 7 T; 0 U; 0 Other;

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered inmunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis. Severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LDS (lippol)saccharide) induced chronic airway disease conditions such as systematic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), cypelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss.

A variant TLR4 mucleic acid is useful as a diagnostic for individuals associated with gram-negative sepsis, pre-term delivery and respiratory distress syndrome presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions auch as systematic inflammatory response syndrome (STRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchitis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84776-823 represent PCR primers for amplifying the exons of human TLR4 gene
                                                                                                                                                                                                                                                                                          Identifying humans at risk of, or having indication associated with altered innate immunity involves detecting or determining whether DNA amplified from a biological sample encodes a portion of variant toll
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 5 A; 4 C; 5 G; 6 T; 0 U; 0 Other;

The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 nucleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, severity of sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, LPS (lipopolysaccharide) induced chronic airway disease, asthma, arthritis, local and systemic inflammatory disease conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchiis, chronic constructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AACH4776-823 represent PCR primers for amplifying the exons of human TLR4 gene TLR4; toll receptor 4; innate immunity; gram-negative bacteria; sepsis; respiratory distress syndrome; LPS; lipopolysaccharide; asthma; ARDS; chronic airway disease; arthritis; inflammatory disease; SIRS; human; systematic inflammatory response syndrome; pyelonephritis; bronchitis; acute respiratory distress syndrome; gall bladder disease; pneumonia; cystic fibrosis; antibacterial; antiinflammatory; PCR primer; ss. The invention relates to human toll receptor 4 (TLR4) nucleic acid and methods to identify polymorphisms at the human TLR4 locus and to identify individuals at risk of, or having, an indication associated with altered innate immunity. A variant TLR4 uncleic acid is useful as a diagnostic reagent for detecting a polymorphism in human TLR4 gene. Since the presence of TLR4 mutation is associated with gram-negative sepsis, pre-term delivery and respiratory distress syndrome in pre-term infants, agents which alter TLR4 activity are useful for preventing or ameliorating infection by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis induced by gram-negative bacteria, sepsis infection by gram-negative bacteria, sepsis inflammatory disease, asthma, arthritis, local and systemic chronic airway disease, conditions such as systematic inflammatory response syndrome (SIRS) or acute respiratory distress syndrome (ARDS), pyelonephritis, gall bladder disease, pneumonia, bronchifis, chronic obstructive pulmonary disease, local gram-negative bacterial infection and cystic fibrosis. Sequences AAC84772-775 represent PCR primers for amplifying the human TLR4 gene

Anti-CD14 monoclonal antibody which inhibits CD14/T lymphocyte receptor binding by specifically recognizing epitope in human CD14 domain to prevent interaction and suppress cell activation, useful for treating

Example 2; Page 46; 156pp; Japanese

The invention relates to an anti-CD14 antibody which can specifically

ö disease through the administration of a Toll-like receptor-4 (TLR-4) inhibitor to a mammal. The TLR-4 protein has been linked to several disease such as atherosclerosis, restenosis, inflammation and other vascular diseases. Compounds which inhibit the activity of TLR-4, through the inhibition of its receptor, may have vasotropic, antiatrosclerotic, thrombolyvic, cardiant and antiinflammatory activities. This may also be achieved through antisense therapy or gene therapy. The method or the system of the invention may therefore be useful for inhibiting or treating a vascular disease, for example atherosclerosis, transplant atherosclerosis, vein-graft atherosclerosis, thrombosis, stent restenosis, angloplasty restenosis, or inflammation and other heart disease. The present sequence is that of a Treating a vascular disease, particularly atherosclerosis, thrombosis, restenosis, stent restenosis or angioplasty restenosis, by administering a Toll-like receptor-4 (TLR-4) inhibitor to a mammal. This invention relates to a novel method for the treatment of a vascular recognise an epitope containing a part of a domain with not less than 8 amino acids in human CD14 in the region from positions 269-315 in a ful defined sequence of 356 amino acids as given in the specification. The antibody is useful in drug compositions for treating sepsis and for screening remedies for sepsis. This polynucleotide sequence represents anti-CD14 related oligonucleotide of the invention Gaps vascular disease; Toll-like receptor-4 inhibitor; TLR-4 inhibitor; atherosclerosis; restenosis; inflammation; vasotropic; antiarteriosclerotic; thrombolytic; cardiant; antiinflammatory; antisense therapy; gene therapy; transplant atherosclerosis; vein-graft atherosclerosis; thrombosis; stent restenosis; angioplasty restenosis; thrombosis; stent restenosis; reverse transcription polymerase chain reaction; RT-PCR; human; ss; TLR-4; Toll-like receptor 4. ö Match 0.5%; Score 20; DB 1; Length 20; Local Similarity 100.0%; Pred. The invention relates to a system for inhibiting the biological activity of myeloid differentiation factor 88 (MyD88) which comprises an intravascular device and a therapeutic composition coated upon the intravascular device, the composition comprising a MyD88 inhibitor. The system or method is useful for treating vascular diseases including attenced tenosis, transplant atherosclerosis, veln-graft atherosclerosis, thrombosis, restenosis, start restenosis or angioplasty restenosis. It can be used for treating patients suffering from angina pectoris, ischaemias, conditions associated with ischaemias including stroke, transfent schaemic attacks, heart attack, osteonecrosis, colitis, poor kidney function or congestive heart failure, poor blood circulation to the extremities and complications of poor blood circulation including slow wound healing, inflammation, infections and claudication. The present sequence represents a human Toll-like receptor 4 TLR-4 reverse

deoxy gap, is targeted to the coding region of human Toll-like receptor 4 man. The exhibite 85% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /mcd base= OTHER /mcdbase= OTHER = phosphorothioate nucleotides, the /note= "OTHER = phosphorothioate nucleotides, the oligomucieotide comprises a central gap region of 10 2'-deoxymucieotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

The present sequence is that of antisense oligonucleotide ISIS #114650. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decxy ago, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 79% inhibition of human Toll-like receptor expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                receptor 4; receptor; antiinflammatory; immunomodulator;

                                                                                                                                                        The present sequence is that of antisense oligonucleotide ISIS #114629. This chimeric phosphorothioate oligonucleotide, having 2'-WOB wings and selecty gap, is trageted to the S' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 48% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a

                                                                                                                                                                                              The present sequence is that of antisense oligonuclectide ISIS #114638. This chimeric phosphorothioate oligonucleotide, having 2'-MOB wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 11% inhibition of human Toll-like receptor 4 expression in THP-1 cells. More active oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                          New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.

The present sequence is that of antisense oligonucleotide ISIS #114637. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibition the expression of Toll-like receptor 4 in cells or itssues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune

Human Toll-like receptor 4 antisense oligonucleotide ISIS #114648.

08-SEP-2003 (first entry)

```
The present sequence is that of antisense oligonucleotide ISIS #114633. This chimeric phosphorothicate oligonucleotide, having 2'-MOB wings and a decoxy gap, is trargeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 69% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonuclectides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune
oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"

The present sequence is that of antisense oligonucleotide ISIS #114648. This chimeric phosphorothioate oligonucleotide, having 2'-MOB wings and a decoyy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 73% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Thl or Th2 immune

This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and adeoxy gap, is targeted to the 5' untranslated region of human 7011-like receptor 4 mRNA. It exhibits 33 inhibition of human 7011-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                       ö
                                                   The present sequence is that of antisense oligonucleotide ISIS #114634. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibites 55% inhibition of human Toll-like receptor 4 expression in THP-1 cells. Such oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /notes "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating Toll-like receptor 4 gene
                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                     The present sequence is that of antisense oligonucleotide ISIS #114635. This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a deoxy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 51% inhibition of human Toll-like receptor 4 expression in THP-1 cells. Such oligonucleotides are useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Th1 or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of antisense oligonucleotide ISIS #114652. This chimeric phosphorothioate oligonucleotide, having 2'-MOB wings and edeoxy gap, is targeted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 85% inhibition of human Toll-like receptor expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence is that of antisense oligonucleotide ISIS #114626. This chimeric phosphorothioate oligonucleotide, having 2'-MOB wings and a decoxy gap, is targeted to the 5' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 15% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonuclectides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator;

Human Toll-like receptor 4 antisense oligonucleotide ISIS #114653

(first entry)

08-SEP-2003

ACC83597;

```
The present sequence is that of antisense oligonucleotide ISIS #114643. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a decoyy gap, is targeted to the coding region of human Toll-like receptor 4 mRNA. It exhibits 86% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
                                                                  /note= "OTHER = phosphorothioate nucleotides, the oligonucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.5%; Score 20; DB 1; Length 20;

This chimeric phosphorothicate oligonucleotide, having 2. *MDE wings and a decay gap, is trageted to the 3' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 72% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a

                                         This chimeric phosphorothioate oligonucleotide, having 2'-MOE wings and a decoxy gap, is targeted to the 5' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 47% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Toll-like receptor 4 in cells or tissues. The oligonucleotide is a particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, Toll-like receptor 4; receptor; antiinflammatory; immunomodulator;

                                                                                                                                                                                                                                                                                              The present sequence is that of antisense oligonucleotide ISIS #114627. This chimeric phosphorothicate oligonucleotide, having 2'-MOE wings and a deoxy gap, is trageted to the S' untranslated region of human Toll-like receptor 4 mRNA. It exhibits 30% inhibition of human Toll-like receptor 4 expression in THP-1 cells. It is useful for inhibiting the expression of Poll-like receptor 4 in cells or tissues. The oligonucleotide is particularly useful for treating or preventing a disease or condition associated with Toll-like receptor 4, e.g. an inflammatory disorder or a condition involving an immune response, particularly Thl or Th2 responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; Toll-like receptor 4; receptor; antiinflammatory; immunomodulator; phosphorothioate; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /mod_base= OTHER /mosphorothioate nucleotides, the /note= "OTHER = phosphorothioate nucleotides, the oligomucleotide comprises a central gap region of 10 2'-deoxynucleotides, flanked on both sites by 5-nucleotides wings composed of 2'-methoxyethyl nucleotides"
                                                                                                                                                       New antisense oligonucleotides for modulating Toll-like receptor 4 gene expression, particularly useful for preventing, delaying or treating e.g. inflammatory disorders, or conditions involving Th1 or Th2 immune
